

The CSM Agent — Proactive Agentic Adoption Journey

A collection of AI agents that monitors product usage, identifies where customers are not getting full value, and delivers personalised guidance at scale — with CSMs reviewing the interactions that need their judgment.

Executive Summary What we're building and the plan	The Story Why it matters, for whom	Engineering Detail How it works, component by component	ExCo Submission Appendix — Big Bet template
--	--	---	---

The CSM Agent is a collection of five specialised AI agents that monitors product usage across the customer base, identifies adoption gaps and relevant product releases, drafts personalised outreach in each CSM's voice, and routes messages through the right channel. CSMs review the interactions that need their judgment. Everything else is delivered at scale. **Built to work across all LSEG products. Workspace and World Check 1 are the proof points.**

HOW IT WORKS — END TO END

WHEN CSMS REVIEW BEFORE SENDING — AND WHEN IT GOES AUTOMATICALLY

CSM reviews first • High-influence or frustrated customers • A product enhancement that directly matches a customer's prior request • Complex topics that benefit from a more considered conversation • First outreach to a new senior contact at any account • Any strategic account interaction	Sends automatically • Routine onboarding nudges for new users • Low-complexity feature tips for active users • Product release alerts for self-service features • Long-tail accounts without dedicated CSM coverage • Message types with consistently high unedited acceptance rates over time
--	---

✓ What Already Exists • Customer usage data and feedback, both in Snowflake	✗ What Needs to Be Built • Signal detection rules and scoring logic in Snowflake
--	---

- Gainsight for email delivery and in-product messaging, with native connections live April 2026. Gainsight PX and CS already fully integrated for World Check 1; Workspace integration underway.
- Microsoft Copilot Studio for building and coordinating agents
- Snowflake Cortex — intelligent search capability built into Snowflake, used by agents to search knowledge bases
- VOC data tagging via the QAS mechanism already started; deeper build-out partially in flight

- Four searchable knowledge bases: customer feedback, approved content, in-product engagement history, and a CSM voice archive
- A decision rulebook and approved content library
- The five agents, coordinated in Microsoft Copilot Studio
- A CSM review inbox inside Gainsight
- Outcome tracking and a feedback loop to improve the system over time

⚡ Cross-Team Dependencies

- Product org: tag every release with six standard fields so the agent can match new features to the right customers
- Content org: write a short, role-appropriate description for each enhancement
- CSAM AI Working Group: define what good adoption looks like per product and approve the playbooks the agents draw from
- Corporate Engineering AI team: alignment needed on shared infrastructure — Snowflake connections, Skills Middleware, and MCP Gateway coverage

⚠ Risks to Address Early

- Signal quality — the system is only as good as the signals it is built on. These must be designed carefully with the Working Group before build begins.
- Draft quality — CSMs will not use a review queue they do not trust. Early draft quality is the single biggest factor in whether this succeeds.
- Product tagging — needs a named owner in the product org or it will not happen consistently
- Legal clearance — communication consent by jurisdiction, FCA/MiFID II content review, and an AI vendor data processing agreement need to be initiated now, not at launch
- Group AI Steering Committee approval — required before automated sends go live
- Change management — a significant shift for CSMs, the product organisation, and operations. See below.

Change Management — Not an Afterthought

- **For CSMs:** This is a new way of working. For accounts in the long-tail segment, customers will begin receiving highly personalised, automated outreach — a step-change from how most of those relationships have historically been managed. CSMs need to understand why the system sends what it sends, trust that the quality meets their standard, and feel that it extends their capability rather than bypasses their judgment. Adoption of the CSM review queue depends entirely on this.
- **For the product organisation:** Embedding a six-field tagging step into every product release is a material change to how the product org operates. More significantly, this changes the way product communicates enhancements to customers — moving from broad, manually coordinated outreach to a system-driven, personalised model. This requires leadership alignment, not just process change.
- **For the content organisation:** Authoring a short, persona-appropriate description for every release, on a regular cadence, is a new ongoing commitment. The quality of what the agent delivers is directly dependent on the quality of what the content org provides.

- **Timeline:** Change management planning should begin at the same time as the technical build — not after it. For the Workspace pilot specifically, CSM enablement should be in place before automated sends begin.

Key Milestones — Q2 to Q4 2026

Workspace is the primary proof point. Each phase builds on the one before it.

Q2 · MAY–JUN

Define the first signals

Working Group agrees on 5–8 signals with severity thresholds. Data audit confirms what is available.

Foundation

Complete Workspace PX and CS integration

Integration in progress. World Check 1 is already live as the reference. Required for in-product delivery in the pilot.

In Progress

Product tagging process live

First releases tagged. Habit established before volume increases.

Foundation

Content Build Agent — MVP

Early version of the Content Build Agent delivered to support current digital CX promotional campaigns through the joint intake and governance process.

Early Win

Q2/Q3 · JUL–AUG

Signal detection live

Computed signal tables refreshing daily. First signals firing for Workspace users.

Foundation

Four searchable knowledge bases built

Customer feedback, approved content, engagement history, and CSM voice — all built in Snowflake Cortex.

Foundation

Content library seeded

First playbooks and enhancement descriptions authored and approved by the Working Group.

Foundation

Q3 · SEP–OCT

Workspace automated pilot

Long-tail accounts. Automated sends only. Outcome tracking live from day one.

Pilot

CSM voice archive seeded

A small group of CSMs review early drafts. Accepted messages build the voice archive before full rollout.

Pilot

Outcome tracking live

Feature adoption at 14 and 30 days logged from day one of the pilot. Without this, the system cannot improve.

Critical

Q4 · NOV–DEC

CSM review queue live

Accept, edit, or discard inbox for risk interventions and product enhancement matches. Workspace CSMs first.

Scale

First performance review

Working Group reviews signal performance, content effectiveness, and CSM draft edit rates. First calibration.

Scale

2027 expansion planned

Workspace and World Check 1 results inform which products come next.

Scale
